PET Film Technology Introduction

We are the King of Synthetic Leather

Technical analysis

Function

Attention point

working way

| | | |
|-----------|---|----------|
| Item | → | PETF-188 |
| Thickness | → | 188um |
| Width | → | 1500mm |
| Length | → | 1000m |
| GSM/M | → | 420gsm/m |

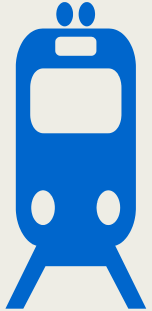

It is the same process with release paper, but more smooth and flat surface than release paper.

This is synthetic leather made up of PET film.

The film can be reusing over 120 times, greatly lowers the production cost.

1. Cleaning, good package for guide roller, in case of any damage and seal lines come out.
2. Please joint 15-20 meter as guide paper before winding, in case of any waste.
3. Please close it if the side machine has Infrared, otherwise it will be off track.
4. The Joint was connected by Anti-High temperature.

1. Keep the workshop clear and tidy, better if non-dust.

2. Must keep the humidity between 140 degree to 150 degree.

3. Must be packed by paper and fabric for the touching surface of guide roller during using.
4. Be connected between front and back by guide fabric, better for final winding.
5. Keep the producing speed at 12 meter / min, in case curly because of not drying.
6. Must 100 % drying before laminated with wet base, otherwise will be curly in the oven after laminated. In case this phenomenon happening, suggesting re-drying and Stereotypes before laminated.
7. Don't using the infrared for side adjusting during producing cause the material is transparent.
8. This production can be reusing over 100 times, suggesting black or darker color for the first 50 times, and light or white color after first 50 times.

THE END

THANK YOU
